

# AerisControls

# aeris™

Aeris offers a specialised range of hardware controllers for the operating assets found in climate controlled environments. Bridging communications across multiple control platforms, Aeris now offers a versatile control solution to suit any application or desired outcome.

## Smart Thermostats

An intelligent first step in control and visualisation of your operating asset. Our new wall mounted, Wi-Fi controllers and thermostats automatically adapt to maximise occupancy comfort whilst minimising energy consumption. These smart thermostats are completely scalable and can be integrated with any future Building Management System (BMS) requirements.

## Modular Control Solutions

Controllers that are high in performance and high in versatility. These controllers are easily adapted to individual operating assets and also suit existing Building Management Systems (BMS) infrastructure or can be customised to form part of a future proof network solution.

Commissioning and ongoing system maintenance is simplified with these units resulting in less asset down time and less ongoing maintenance.

## Complete Building Automation

The central platform from which individual operating assets can be pulled together to create meaningful and valuable data for all building managers. Aeris has simplified open protocols to create the AerisView platform. AerisView is a Building Management System (BMS) that introduces a dynamic operational environment for building services and facility management.

Real time visualisation of the building operating assets allows building managers to control, optimise and develop strategies to create increased efficiency across operational functions from HVAC&R, lighting and indoor air quality, to occupancy and better space utilisation.

- ✓ Real time, simple control of essential services
- ✓ Optimise energy efficiency
- ✓ Develop peak demand strategies
- ✓ Reduce maintenance costs
- ✓ Increase asset life expectancy
